

ABSTRACT OF THE DISCLOSURE

The diaper with legs of the present invention is a lower torso garment worn by a user to retain excreted waste matter. The diaper may have fasteners to close the waist and legs, or
5 may be of the pull-on type. The diaper includes a flat sheet wrapped around the torso with legs extending from the sides of the sheet. A front waist arch and a rear waist arch are disposed at an upper portion of the edges of the sheet. The arches extend the height of the diaper in front and back. An
10 elastic material is disposed at the waist arches, at the junction between the legs and the central portion of the diaper, and at the end of the legs. The elastic material disposed at the end of the legs and at the junction between the legs and the central portion provide double leak protection at the legs.
